## EDUCATION

---

**Columbia University**, *Fu Foundation School of Engineering And Applied Science*

B.S. Computer Science

New York, NY

Expected Grad: May 2029

- Relevant Coursework: Data Structures & Algorithms, Multivariable Calculus

## SKILLS

---

**Languages:** Java, Python, C++, Javascript/HTML/CSS, SQL, PostgreSQL

**Frameworks & Libraries:** React, FastAPI, PyTorch, LangChain, WebSocket, REST APIs, Git

## EXPERIENCE

---

**General Dynamics Electric Boat**

*Software & Systems Engineering Intern*

Providence, RI

Jun 2025 – Aug 2025

- Authored data-parsing scripts to automate the analysis of computational simulation datasets (stress analysis and fluid dynamics), streamlining the material usage evaluation process and reducing manual calculation overhead.
- Evaluated prototype performance metrics by querying and processing large-scale marine condition data, driving iterative, data-driven refinements to improve final design durability.
- Presented technical manufacturing solutions to cross-functional stakeholders from the SBA, Fidelity, General Dynamics Electric Boat, and Skills for Rhode Island's Future.

**University of Rhode Island Wearable Biosensing Lab**

*Research Intern*

Kingstown, RI

Nov 2023 - May 2025

- Developed automated data processing scripts to parse, clean, and analyze physiological datasets collected from wearable biosensor hardware.
- Maintained and debugged laboratory software environments, ensuring reliable real-time data ingestion for ongoing biomedical experiments.

## PROJECTS

---

**Stream Shield** | Python, FastAPI, PyTorch, Redis, Docker, React

July 2026 - Aug 2026

- Engineered a real-time text analysis pipeline for live chat environments, utilizing Redis message queues to decouple high-throughput message ingestion from the PyTorch ML backend.
- Implemented dynamic request batching within the processing layer to evaluate toxicity and spam in real-time, optimizing hardware utilization and reducing prediction latency.

**Brawl Drafter** | Python, PyTorch, React, SQLite

In Progress

- Engineered a full-stack multiplayer drafting recommendation application utilizing a custom PyTorch machine learning model to optimize team compositions based on live game metadata.
- Integrated the official Brawl Stars REST API to ingest, parse, and seamlessly store real-time player statistics and character data into an SQLite database.
- Architected a scalable deployment pipeline by containerizing backend ML inference logic with Docker via Railway, while serving a low-latency React frontend through Vercel.

**sip.** | HTML, JavaScript, CSS

June 2026 - July 2026

- Built a dependency-free hydration tracker using vanilla JavaScript, HTML, and CSS, implementing persistent per-day state management with automatic daily resets based on calendar-date comparison
- Engineered a custom animated liquid-fill visualization using layered CSS composition and requestAnimationFrame-based counter animation with eased transitions
- Implemented light/dark theming via CSS custom properties and a 7-day usage history view with dynamically generated DOM elements
